Phase 6 - verification and demo

Goal: Verify the complete prototype from a clean run, fix defects, and rehearse a defensible demo. Estimated time: 5:30-6:00; allow more time if a correctness check fails.

Verify and finish

1. Run the architecture §14 checklist: final-ticket concurrent reserve, ten repeated joins, concurrent confirm, confirm-versus-expire, refresh/reconnect, buyer/admin authorization, simulation isolation, and invariant after every test.
2. Start from the documented reset/seed path and walk the full buyer flow: event page to join to queue order to admission to reservation to confirmation. Check expired and sold-out explanations as applicable.
3. Run ordinary, retry, and flood scenarios with a fixed seed. Capture the configuration and observed allocations, request counts, throttles, oversells, and duplicate orders. Fix any mismatch between the Lab and database.
4. Rehearse the architecture §15 demo path, including the fairness receipt and the identity/scale limitations. Use this precise claim only if supported: under the displayed test configuration, extra requests from the same account did not create extra queue entries or orders, and inventory remained consistent.
5. If time and credentials permit, deploy to Vercel/Supabase and repeat the critical smoke flow against the deployed environment. Record the tested environment and scale. Deployment is not evidence of 50,000 concurrent users.
6. Update the top-level README or demo instructions with setup, environment variables, migration/seed/reset commands, test and simulator commands, and known limitations.

Exit checks

- All eight architecture §14 verification items pass, with commands/results recorded.
- A clean reset supports the full demo without manual database editing.
- The presented fairness claim matches measured data and the stated test scale.
- Any failed check or untested capacity is explicitly recorded rather than presented as verified.

Final handoff record

Fill in after implementation: files/commits, setup and demo commands, test results, deployment URL if applicable, tested scale, and remaining limitations.
